

Protecting Your Business

Eli Efrat, CEO, Axxana

eli.efrat@axxana.com

Business Check Point

- What are your most critical applications ?
- How long can these application be down ?
- How much data can these application lose ?
- How comfortable are you that you can recover these applications/data in that time frame ?

Data Loss = Down Time = Cost

DR Solutions - Application Replication

Synchronous Replication

- Zero Data Loss (RPO-0)
- Application Consistency

- High cost (Fibre lines, excess nearby data center)
- Limited to short distances
- Affecting application performance
- WAN link failure risk

Asynchronous Replication

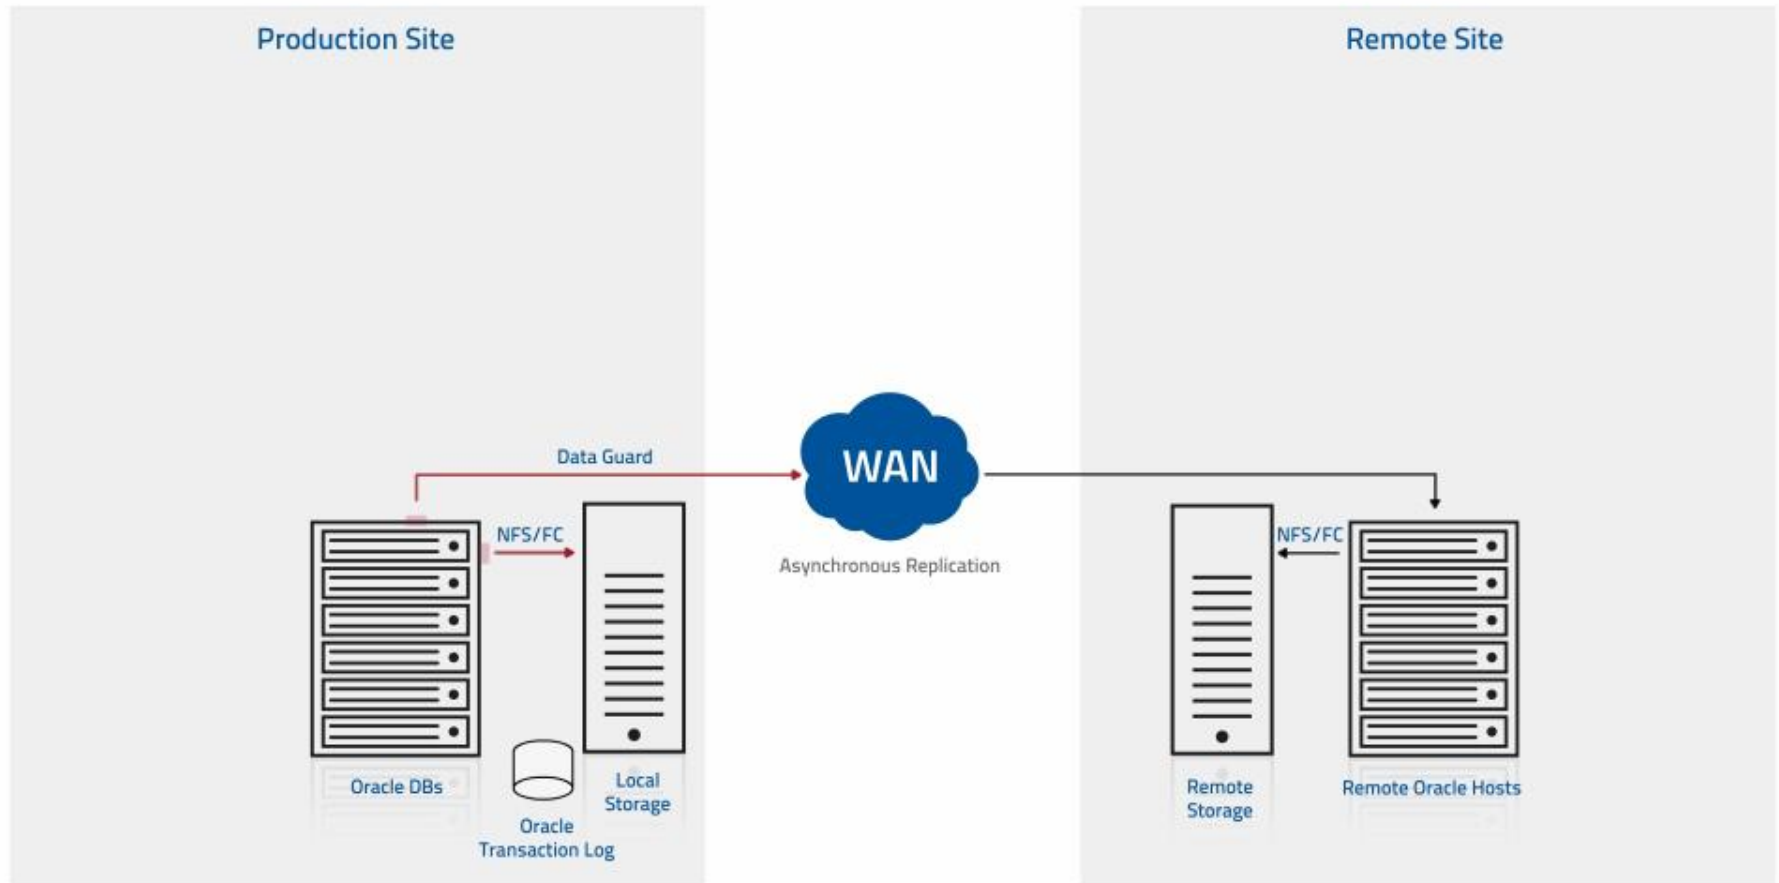

- Unlimited Distances
- Low Cost (IP lines)
- WAN Link failure protection
- Fastest Recovery Time

- "Guaranteed" data loss
- WAN link failure risk

BUILT TO LAST

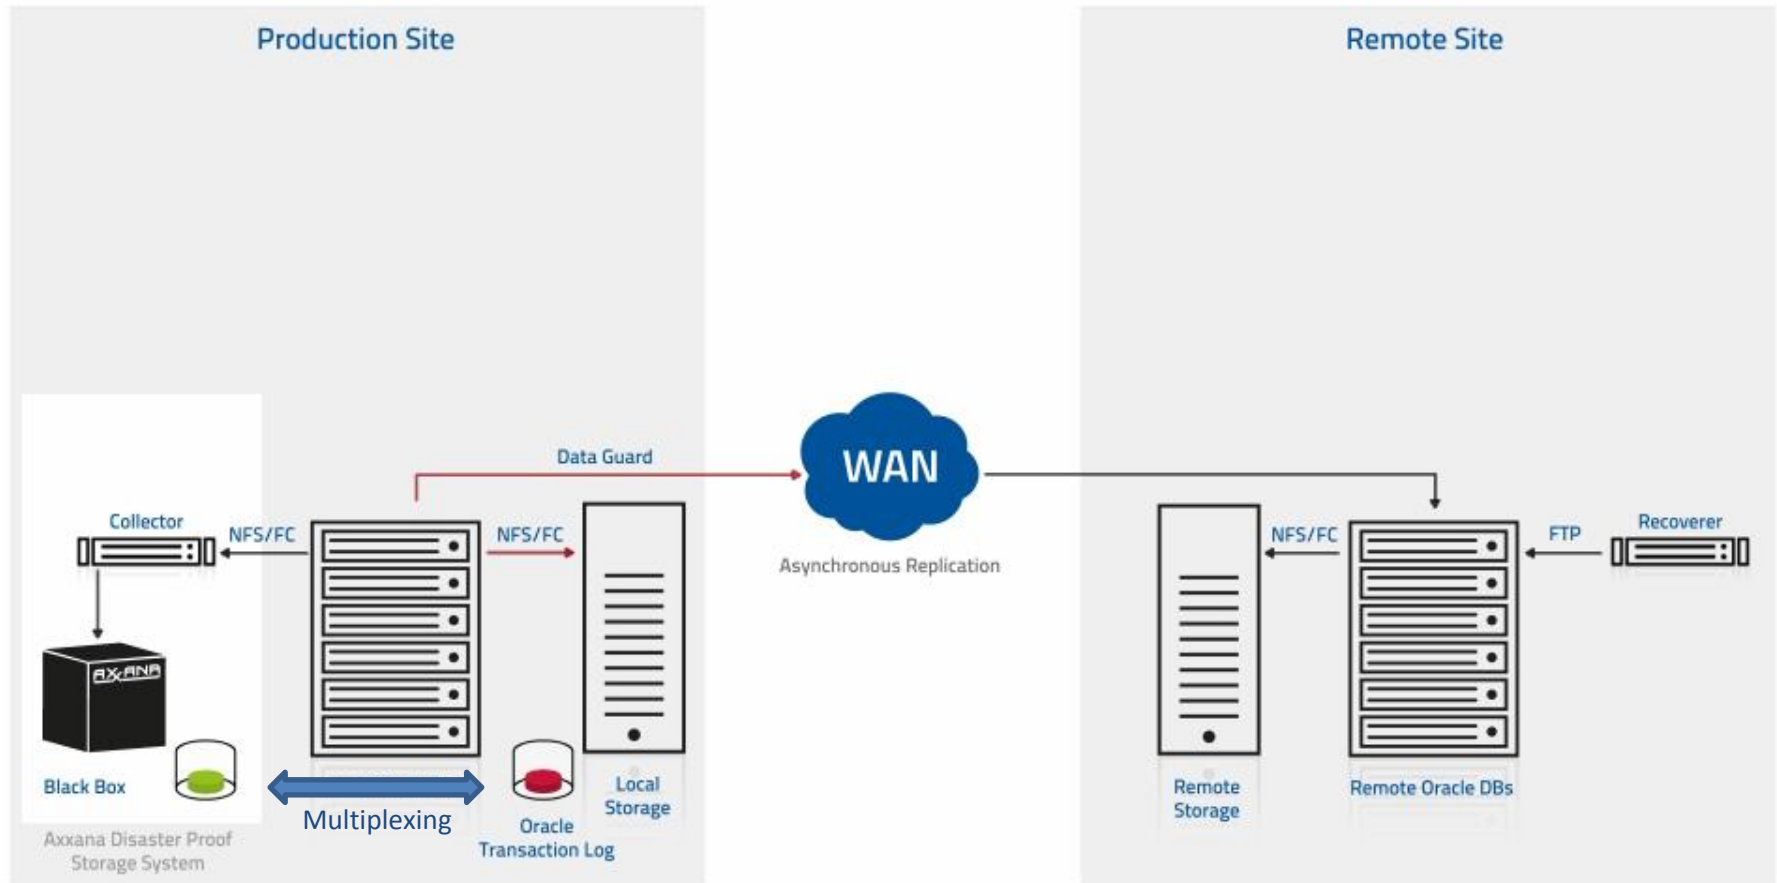

Phoenix System® for Oracle

The Application Inconsistency Challenge

Phoenix System for Oracle Exadata

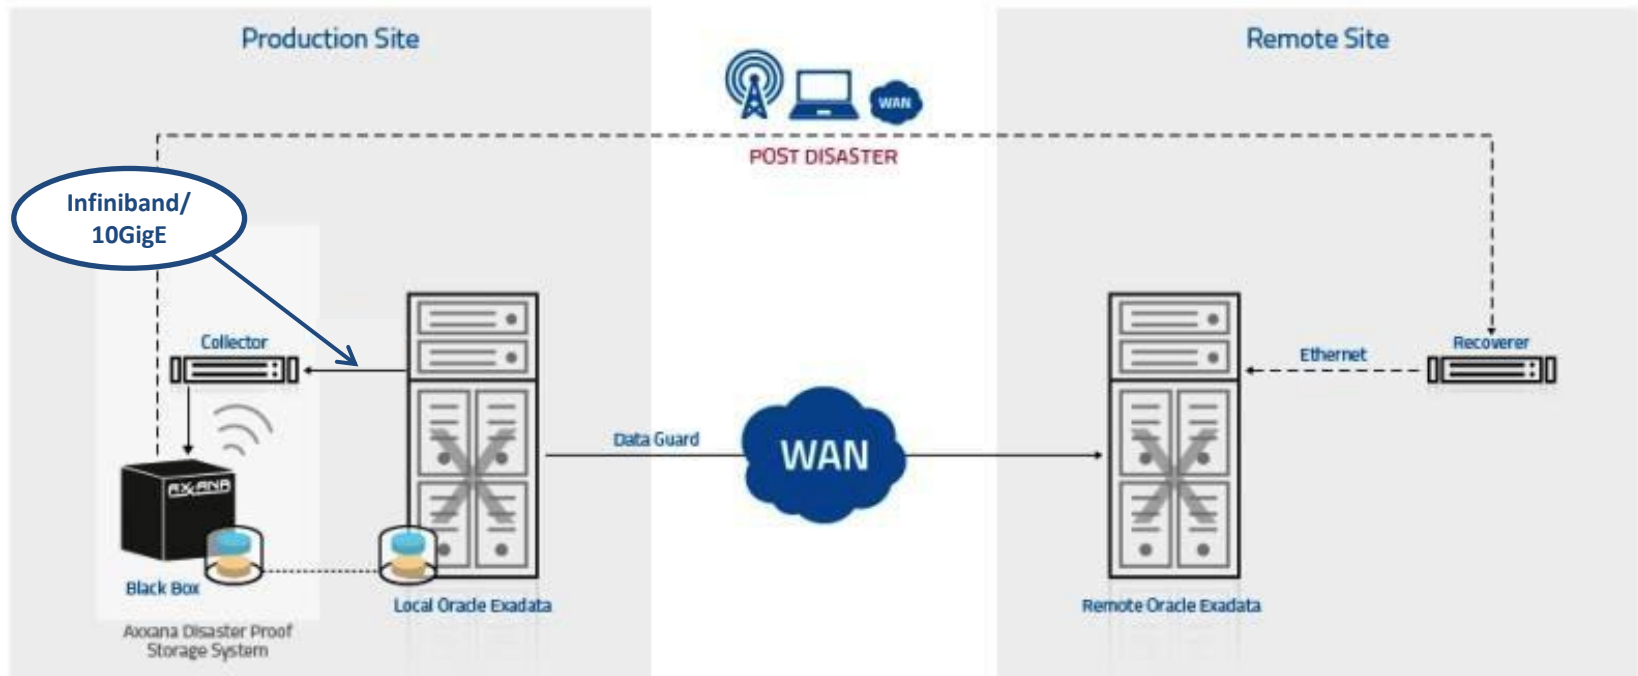

- Optimized Storage Product for the Oracle Database
- Combination of hardware and software
- Mission Critical Availability and Protection

The Challenge:

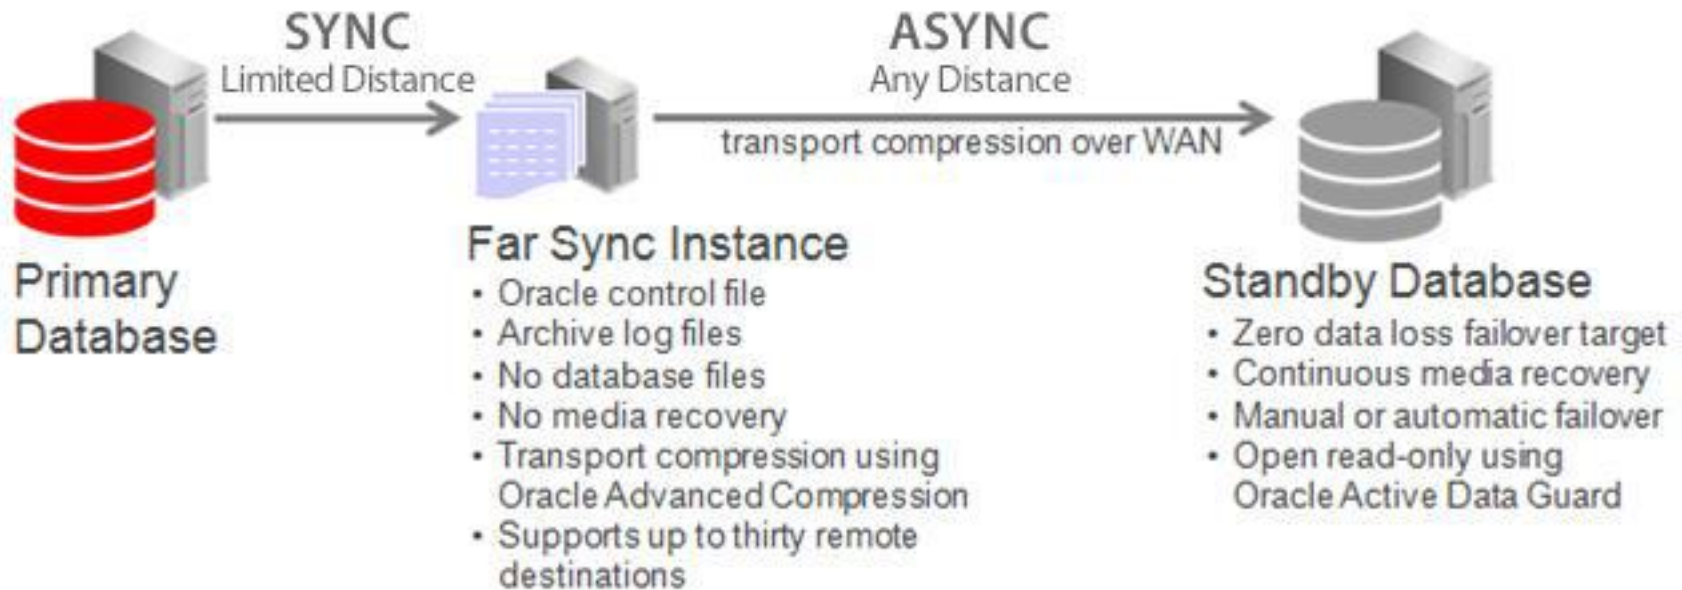

The replication is based on Data Guard, and therefore it will be used in Max Performance or Max Availability modes in most cases

Exadata Topology

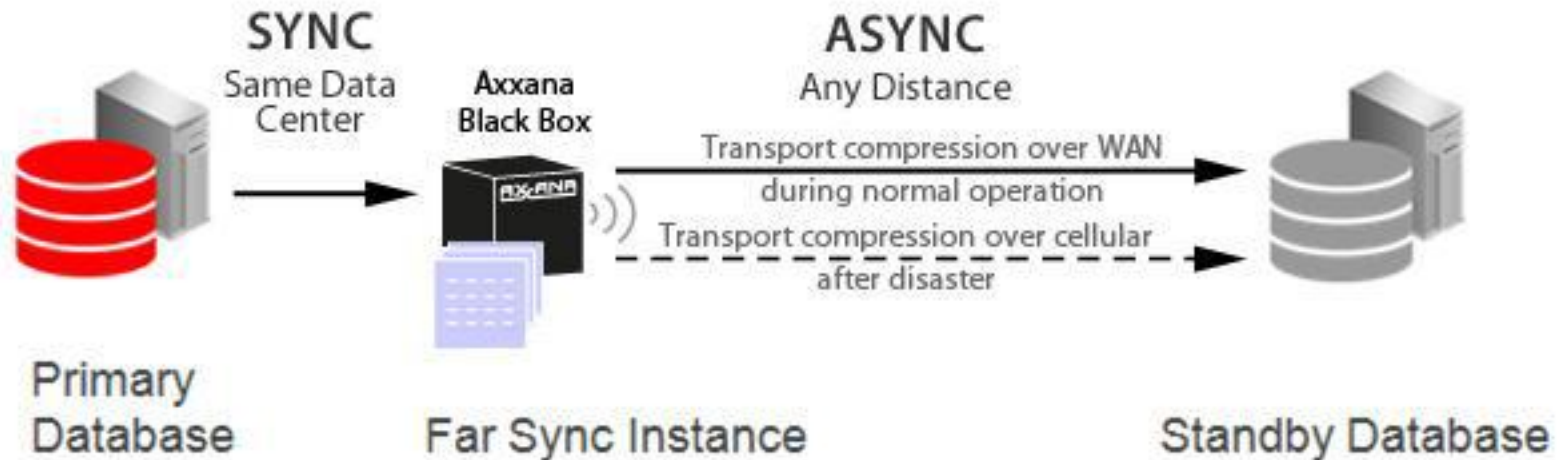

Oracle 12c Active Data Guard Far Sync

- High costs of the nearby data center facility
- High costs of Fiber lines between two nearby DCs
- Vulnerable to link failure
- Vulnerable to regional disasters (e.g. power outage)

Oracle 12c Active Data Guard Far Sync w/Axxana

- No nearby data center facility!
- No costly Fiber lines – there is no nearby data center!
- No risk of link failure – the Black Box is on primary premises!
- ... and will not get destroyed!

See for yourself...

What About Big 'D'?

- How can Far Sync help if the site is gone?
- Far questions
 - If the Far Sync servers all go away, you go back to an Asynchronous follower
 - ~~with a 24-hour delay~~
 - Can you avoid this?
 - Yes, with a well-planned and planned far sync setup.
- One Partner, who's working on such a solution is **EXXANA**
 - I'm not selling their solution nor do I get anything from them.
 - But they are working hard to provide a great Far Sync configuration.

ORACLE

Typical Customer Use Cases

- **Risk Mitigation** - The “Basic” – Zero Transaction Loss over distance, without the need for costly lines
- **Cost Savings** - “3DC → 2DC” – elimination of 3 data center topologies while actually gaining more protection of the business
- **Cost Savings** – Moving Tier-2 applications to cheaper storage – maintaining the same ZDL level of protection
- **Mission Impossible** – ZDL/ZTL for Oracle databases with All Flash Array storage
- Application protected – OLTP, E-Business Suite, SAP...
- Where – Banking/Finance, Insurance, Retail, Manufacturing, Healthcare, Travel, Transport, Tech...

Data Loss = Down Time = Cost
